

Commercial Growers

In-House Or Cloud Multiuser Solutions

Qsys Infinity Commercial Growers Solution

End to End Fully Integrated Production Management & Sales Process Control

Qsys Infinity for commercial growers is the full multiuser package deal that incorporates all the basics needed by a commercial grower. It offers extended production planning options that can adapt to the planning methods required for your specialised needs. It provides the means to label the products to suit your clients' needs, including bespoke layouts for every customer or simple "house" labels for those who just want prices & descriptions. In addition we include "complex labelling solutions" to make best use of all types of print press hardware including large format laser printer solutions. The package includes some 20,000+ varieties of plants, shrubs and trees built into the standard plant library which you can use to plan your production and create product labels, or we can adopt your existing data source and work with you to incorporate your existing assets.

Optional upgrades

- Final Accounts
- Sage Link

Production Estimating

Production Space Estimating

Production Labelling

Sow/Cut Production Planning

Potting Up Planning

Seeding Machines Planning

Production Progress Monitor

Availability Projections

Bespoke Program Modules

Optional Infinity Label Publisher

Commercial Growing Model

Here we show the complete “Data relationship” between our Plant “Master Library”, “Finished Product Lines”, “Growing Batches” and “Planned Production Batches”. This is our “Commercial Growing Model” and works very well where growers predominantly propagate their own stocks.

The flow diagram shows how you can have production plans in place for the next season. These plans are represented as notional batches (that are not physically growing) until you are ready to engage them as growing batches. Once production has been engaged, the planned production batches become real growing batches with time scales and growing points to match your production methods.
